San Jose, CA 95113

Dear Hiring Manager,

I am excited to apply for the Applied AI Engineer position. With more than ten years of experience building production software across mobile, cloud, backend, and computer vision systems, I have always been drawn to solving practical problems with emerging technologies. As generative AI has become a transformative tool for software products, I have expanded my expertise into modern AI frameworks and large language model infrastructure, and I am eager to apply that experience to building AI-powered features that deliver meaningful value to users.

Throughout my career, I have focused on taking ideas from concept to production. As a Senior Software Engineer and CTO at Dodl.es, I led development of cross-platform mobile applications, architected AWS-based microservices, managed Docker-based deployments, and delivered applications used by customers on both Android and iOS. Working closely with product stakeholders long before the recent wave of generative AI. At LIVEALITY, I developed computer vision algorithms for intelligent camera systems, implemented facial recognition and image analysis technologies, and built embedded Linux and mobile applications that integrated machine learning with cloud services. Later, as a consultant, I translated business requirements into scalable software while mentoring engineers and helping shape technical direction.

My experience with artificial intelligence began long before the recent wave of generative AI. At LIVEALITY, I developed computer vision algorithms for intelligent camera systems, implemented facial recognition and image analysis technologies, and built embedded Linux and mobile applications that integrated machine learning with cloud services. Later, as a consultant, I developed a real-time Android application that used deep neural networks to identify plants and animals directly from live camera images.

More recently, I have focused on modern generative AI technologies, working with PyTorch, Hugging Face models, distributed LLM infrastructure using Petals and Hivemind, automated theorem proving, and AI-assisted application development. I enjoy experimenting with new models and techniques, but my primary interest is building reliable, production-ready software that makes AI useful for everyday users. I believe successful AI products require thoughtful engineering, scalable architecture, and close collaboration between engineering and product teams—areas where I have consistently delivered throughout my career.

What excites me most about this opportunity is the chance to help expand AI-powered product experiences and turn innovative ideas into features that customers use every day. I enjoy collaborating across disciplines, learning new technologies, and building systems that balance technical excellence with an exceptional user experience. I would welcome the opportunity to contribute my background in software engineering, cloud architecture, mobile development, and applied AI to your team.

Thank you for your time and consideration. I look forward to discussing how my experience and passion for building practical AI solutions can contribute to the continued success of your platform.

Sincerely,

Paul Klemstine
